

Renox vs Laravel

What Renox still lacks to match Laravel (and Filament), after M33

3 OCTOBER 2026 · CHECKED AGAINST THE CODE AFTER M33 · SUMMARY OF DOCS/AUDIT/2026-10-LARAVEL-PARITY.MD

Summary

For its niche, nearly there in features; not yet in maturity. For HTML-over-the-wire business and SaaS apps on one server or a few, a Laravel developer now finds an equivalent for nearly everything they use daily. What really separates Renox from Laravel is maturity: no release, one maintainer, a week of public history, no packages, docs site or community.

- Every gap the September review (after M17) planned for M18–M21 is closed, and so are the leftovers moved to M22–M25. Of its 94 gap rows, 63 are now equivalent, 16 partial and 15 still missing or not planned, mostly minor.
- Renox went past that scope with Filament's main parts: a data grid (M27–M28), form fields, infolists, actions, notifications and dashboard widgets in the UI kit, navigation and a warm theme (M30–M31), and a back office example in the style of Filament's demo (M29b).
- All five bugs and traps the September review found are fixed.
- M33 closed the small additions the review listed first: 28 validation rules, route model binding, named disks, ETags, the `XSRF-TOKEN` cookie and trusted hosts.
- What is left in code is small: 2FA and social login (planned as plugins), a few validation rules, several mailers, search, broadcasting and billing.

Position in numbers

SIGNAL	AFTER M17 (SEPT.)	AFTER M32 (OCT.)
Milestones	M0–M17	M0–M33, plus the kit PRs #88–#99
Rust in <code>crates/</code>	~34k lines	~65.3k lines
Examples	11 (~5.3k lines)	14 (~15.9k lines)
Test functions	~400	763, plus doctests
Guides in <code>docs/</code>	6	15
<code>rnix make:*</code> generators	9	16 (Laravel: ~35)
Validation rules	–	68 on <code>Field</code> (Laravel: ~100)
UI kit macros	none	64, plus the data grid
Releases	none	none: <code>crates.io</code> holds 0.0.1 placeholders; apps pin a git commit
Maintainers, stars, issues	1, 0, 0	1, 0, 0

Status per area

Rows of the review's tables (the September gaps plus the rows added in October).

AREA	EQUIVALENT	PARTIAL	MISSING	NOT PLANNED
HTTP, routing, validation	16	4	5	–
Data: query builder, models, relations	16	4	1	2
Auth, authorization, security	11	1	5	–
Background work and services	15	5	3	1
Views and frontend	18	3	2	–
Tooling, testing, ecosystem	7	6	2	2

What closed since September

MILESTONE	CLOSED
M18	tenancy (default scopes, scoped unique / exists), roles and permissions, token abilities, account pages, password policy, per-device logout, auth events and the audit log, bcrypt import
M19	raw fragments, group_by / having , locks, where_has , count/sum loaders, cursor and simple pagination, transaction retries, model hooks, partial saves, pivot data, polymorphic relations
M20	cron schedules in IANA time zones, cache locks, unique/encrypted/prioritised jobs, job middleware, chains and batches, an HTTP client with a fake, the queue dashboard, localized mail
M21	components that see the request, the UI kit, toasts, live validation, resource routes and generators, test assertions, time travel, fakes, error reports, JSON logs, named rate limiters, the debug inspector, Tailwind, typed commands, form-request hooks, database sessions, socket activation
M22–M26	ULID/UUID/string keys, savepoints, encrypted fields, domain and fallback routes, route_is , factory states, plural ranges, #[derive(Validate)] , the browser's language; every public item documented
M27–M28, #88–#99	the data grid (Filament's tables); Filament's forms, infolists, notifications, widgets and actions in the kit
M29–M33	fourteen complete examples including a back office, every example on the kit, navigation and page frame, the warm theme and type scale, an English-only codebase; validation rules, route model binding, named disks, ETags, the XSRF cookie, trusted hosts

Still open, ranked

1. **Maturity (blocker):** a crates.io release with cargo-semver-checks , a docs site with a tutorial and a "Laravel to Renox" guide, docs.rs, a starter kit, a support policy, and a community.
2. **Two-factor authentication (major):** TOTP and recovery codes, as the renox-2fa plugin.
3. **Social login (major):** the renox-oauth plugin.
4. **Small additions (minor):** most closed in M33. Left: a public current_password rule and an optional HIBP check; several mailers with failover; named error bags and session keep / now ; hasManyThrough ,

polymorphic many-to-many, row streams; cache tags, queued listeners, model pruning; optional route parameters.

5. **Admin (minor):** whether a `renox-admin` crate is still worth it, now that the kit, the grid, `make:module --resource` and the back office example cover what Filament's panels give; global search and rich editors.
6. **Search (major for some apps):** a Scout-like interface over SQLite FTS5 or PostgreSQL `tsvector`.
7. **Realtime (minor to major):** general Server-Sent Events broadcasting, grown from the notification bell's stream. WebSockets stay not planned.
8. **Billing (major for SaaS):** subscriptions in the style of Cashier; feature flags (Pennant) with it.

Not planned: a schema builder, Redis, WebSockets, Livewire/Inertia, serverless deploys and a REPL (Tinker).

Where Renox is already ahead

- **Deploy:** one binary runs the web server, workers and scheduler, with views, translations, fonts and migrations embedded; no Redis, Supervisor or cron entry; deploys without refused connections through systemd socket activation.
- **Security by default:** CSP with nonces, uploads checked by content and served sandboxed, a login lock shared across servers, verified and idempotent webhooks, typed forms, encrypted columns.
- **Data:** no N+1 by design, compiler-checked columns identical on SQLite and PostgreSQL, transactional job dispatch, a migrator with checksums and all-or-nothing rollback.
- **A data grid and UI kit in the framework,** with no JavaScript build: Filament's tables, forms and widgets from Rust values and template calls.
- **Tests:** every test gets its own migrated database, in parallel; time travel reaches the queue, sessions and rate limits.

Recommendation

The code no longer stands between Renox and Laravel for its niche; maturity does. The highest-value next step is v1.0 (when the owner decides to start it): an API audit with semver checks, real crates.io releases, and a docs site with a tutorial and a Laravel guide. Then the 2FA and social login plugins, then the small additions above.

Full tables, with the Renox API and the milestone for every row: [docs/audit/2026-10-laravel-parity.md](#). Replaces the September gap report (made after M20b).
